## Parts needed for Project

Raspberry Pi 4, 4Gb Ram €49.63

RS Components → Stock No. 182-2096

Auvidea B107 HDMI to CSI-2 bridge

€69.90 Auvidea website

Raspberry Pi 4 Plug €12.17

Farnell → 3106944

Raspberry Pi, relay board shield €30.78

RS Components → Stock No. 174-3270  
or

✓ Farnell → 2434230 €29.00

or

Farnell → 2451886 €14.25

Git username: Noddy26

Name for Project

remote Gaming Server

Game anywhere Server

Gaming world-web emulator

Playstation streamer

Phone Gamer

Playstation App player

Playstation App Emulator

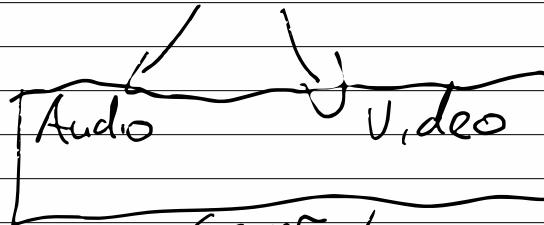

25/09/2019

Playstation

↓ HDMI output

raspberry pi

HDMI input

Stream  
internet

Android app

Cast to tv  
use phone as  
control

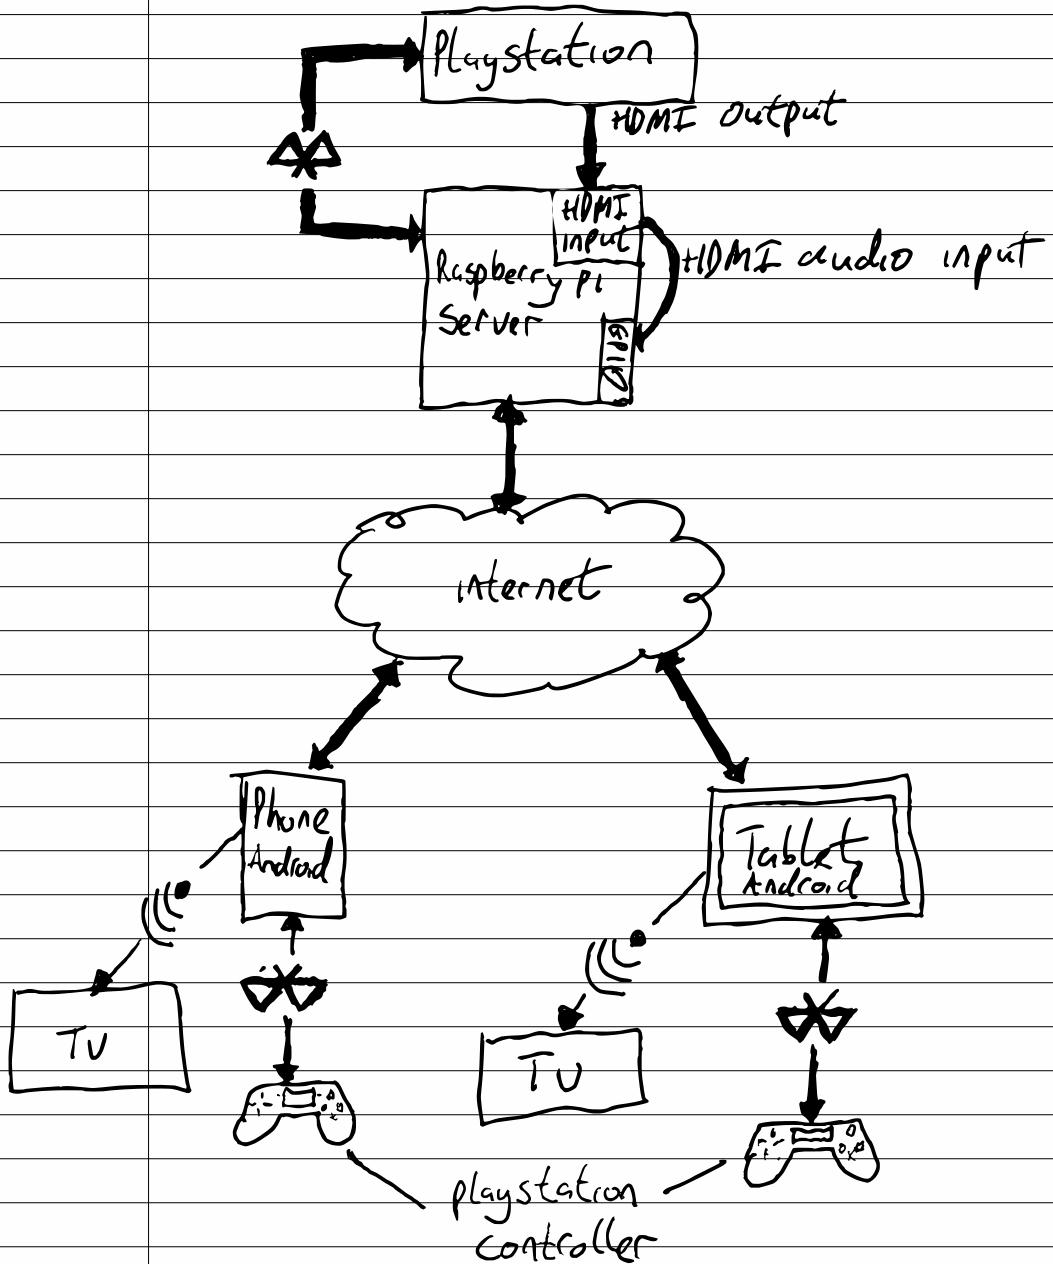

Play on phone  
using a bluetooth  
control

- ① Got HDMI input working
- ② Look into digital Audio input GPIO pins
- ③ Server side file, Python script to break video into packets and audio send it over internet

Audio and video must be synced before being streamed

Android app will make a request to the server for to stream video and audio to the phone. The app will have two choices. First choice will be to play video on the phone and connect a PlayStation controller to the phone and send button presses back to the server to send them to the PlayStation. Second choice will be to cast video and audio to a tv and either use the phone as a controller or connect PlayStation controller to the phone, both choices will send button presses back to the server to communicate with the PlayStation.

## Raspberry Pi GPIO Pins

Power	3V3	1	2	5V	Power
SDA1_I2C	GPIO 2	3	4	5V	Power
SCL1_I2C	GPIO 3	5	6	Gnd	
	GPIO 4	7	8	GPIO 14	UART - TxD
	GND	9	10	GPIO 15	UART - RxD
	GPIO 17	11	12	GPIO 18	PCM-CLK
	GPIO 27	13	14	GND	
	GPIO 22	15	16	GPIO 23	
Power	3V3	17	18	GPIO 24	
SP10-MOSI	GPIO 10	19	20	GND	
SP10-MISO	GPIO 9	21	22	GPIO 25	
SP10-SCLK	GPIO 11	23	24	GPIO 8	SP10_CE0_N
	GND	25	26	GPIO 7	SP10_CE1_N
I2C-ID-EEPROM	ID_SD	27	28	ID_SC	I2C-ID-EEPROM
	GPIO 5	29	30	GND	
	GPIO 6	31	32	GPIO 12	
	GPIO 13	33	34	GND	
	GPIO 19	35	36	GPIO 16	
	GPIO 26	37	38	GPIO 20	
	GND	39	40	GPIO 21	

Server will be programmed in python on  
Raspberry Pi, and some bash scripts.

The client android app will be programmed  
in Java

# HDMI Bit Depth - Color Sampling

8-bit

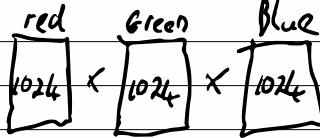

256 shades

16 million

10-bit

1024 shades

1 billion

High bit depth more colors can be captured

4:4:4 - full color

Luma is relative

4:2:2 - 1/2 color

Luminance of a weighted sum of linear RGB components

4:2:0 - 1/4 color

color      color  
Luma Row A    Row B

4 : 4 : 4

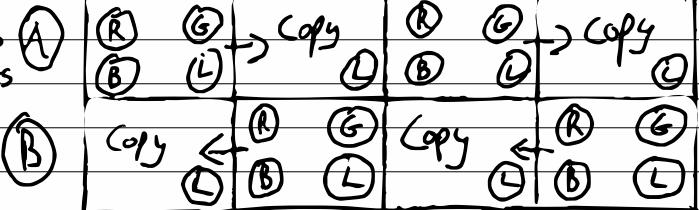

Row B will sample the opposite of Row A to spread the image evenly

color      color  
Luma Row A    Row B

4 : 2 : 2

Every Luma channel is sampled. (A)  
only samples 2 of the 4 pixels  
The other pixels are copied  
which will reduce file size

## Auviidea B101 HDMI to CSI-2 Bridge

HDMI Signals does not match the Signals expected into the Camera Serial Interface.

TPD12S521

electro - static discharge circuit protection device for high - definition multimedia interface.

High speed transmission line with level translation and Buffering for HDMI DDC, CEC and hot plug signals

Is used for a HDMI receiver

NXP Design

<http://www.nxp.com/PDF/1P4786CZ32.html>

### B101 HDMI to CSI-2 bridge

The bridge is needed to convert the HDMI input data to the camera Serial interface required data so it can processed by the SOC.

11/10/19

## Why serial transmission is used?

Serial communication uses fewer wires, this makes serial communication signals clearer. The signal frequency can be increased, parallel need to arrive at the same time.

Serial transmission is slower than parallel when the signal frequency is the same.

Parallel can transfer one word per cycle 8 bits  
Serial 1 bit

Parallel signal frequency has a limit all signals must arrive together with high frequency's this can not be guaranteed.

Waiting for each bit to sync up will lower transfer rate

The higher signals can result in crosstalk with parallel signals and the word can get corrupted.

Serial transfers less data per cycle but can go to much high frequencies, which result in a higher net transfer rate

Synchronization is also a big problem when parallel signal frequency gets higher.

13/10/19

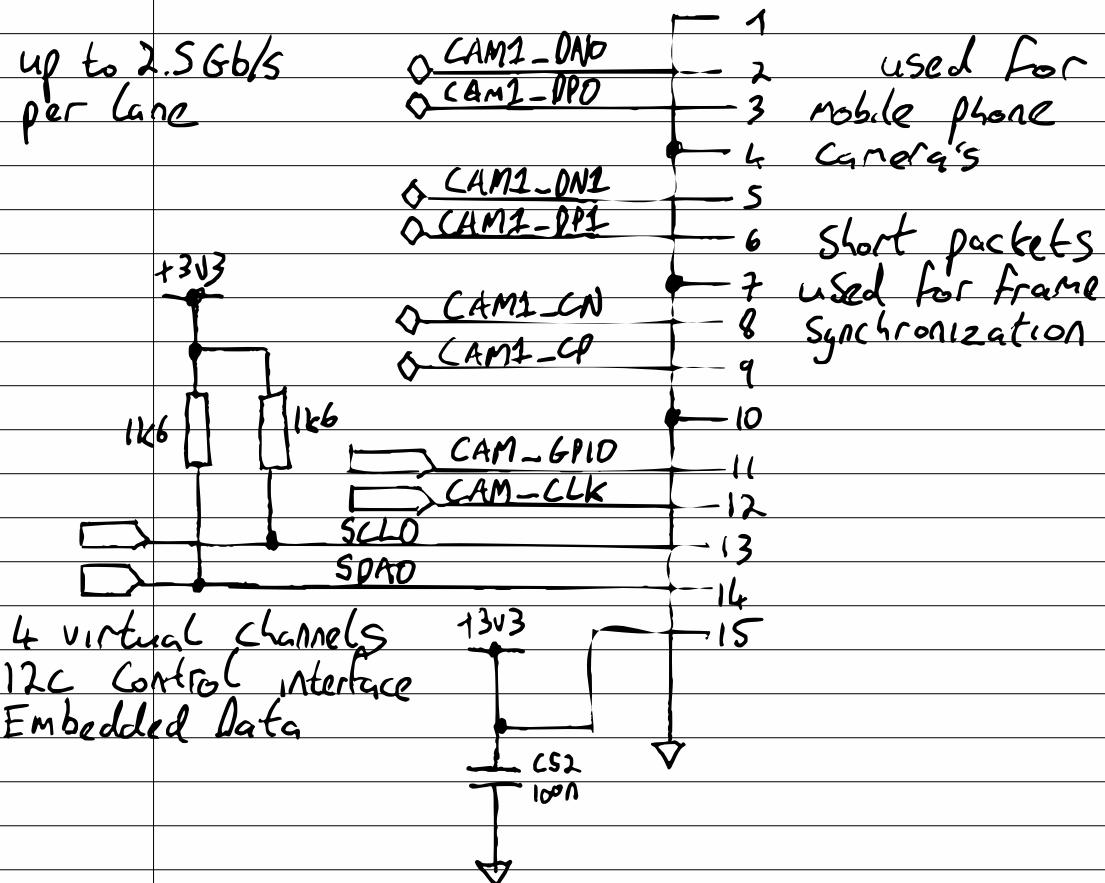

# Raspberry Pi Camera Serial Interface

15 pin Socket

Allows data rates up to 800mbps per serial pin

1 Gbps each pin set as the limit

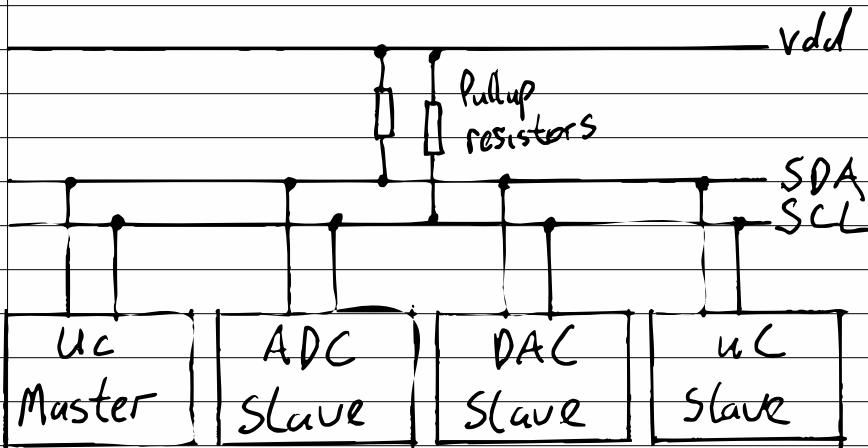

CSI-2 directly to SOC processor!

14/10/19

# Raspberry Pi I<sub>2</sub>C for Audio input

I<sub>2</sub>C is Serial Protocol for two-wire interface to connect low-speed devices like microcontrollers, EEPROMs, A/D and D/A converters, I/O interfaces and other similar peripherals in embedded systems. Each I<sub>2</sub>C Slave needs an address.

up to 100 kHz

Transfers 8 bits or bytes

Each slave device has 7-bit Address. Other bit is used to signal reading from or writing to the device.

Master device generates the clock, doesn't need an address.

Can have up to 128 devices connected  
Raspberry Pi has 127 available address

24/10/2019

## Making a static IP Address

Raspian by default uses dhcpcd to manage network interfaces.

Vim /etc/dhcpcd.conf

Change wifi

Sudo iwlist wlan0 scan

Sudo Vim /etc/wpa\_supplicant/wpa\_supplicant.conf

Check change = ifconfig wlan0

Sudo reboot

IP Address 192.168.0.102

Sudo Vim /etc/resolv.conf

Nameserver 192.168.0.1

Sudo Vim /etc/dhcpcd.conf

Interface wlan0

Static IP\_address = 192.168.0.13/24

Static routers = 192.168.0.1

Static domain\_name\_servers = 192.168.0.1 8.8.8.8

25/10/2019

Commands for monitoring

CPU Temp - /opt/vc/bin/vcgencmd measure\_temp

Top -b 1 head -n S

↳ Give memory usage

Cpu usage

Tasks running

127.0.0.53

192.168.0.103

192.168.0.255

28/10/2019

## Python flask Server app is For

Registering an account and getting confirmation of registration, then being able to download a mixture of a Java GUI and Python GUI, which also consists of a login this login GUI connects to a Java Server on the PI, which will verify a user from the MySQL database on the PI, then the main GUI written in python will appear and a second server will be started to stream video and audio to the python GUI, so the user can interface with the input from the playstation.

Connections will be added for playstation controller to be connected to the GUI via bluetooth and the signals from the controller will be sent back to the server and relayed to the playstation, so the user can play the game remotely.

1/11/2019

## Installing Python 3.7.2 on Raspian

Sudo apt-get update -y

Sudo apt-get install build-essential tk-dev libncurses5-dev libncurses5-dev  
libreadline6-dev libdb5.3-dev libgdbm-dev libsqlite3-dev libssl-dev libbz2-dev  
libexpat1-dev liblzma-dev zlib1g-dev libffi-dev -y

Install build tools required

get python package

Wget <http://www.python.org/ftp/python/3.7.2/Python-3.7.2.tar.xz>

Then un-tar the file

tar xf Python-3.7.2.tar.xz

cd Python-3.7.2

/configure

make -j 4

Sudo make altinstall

02/11/2019

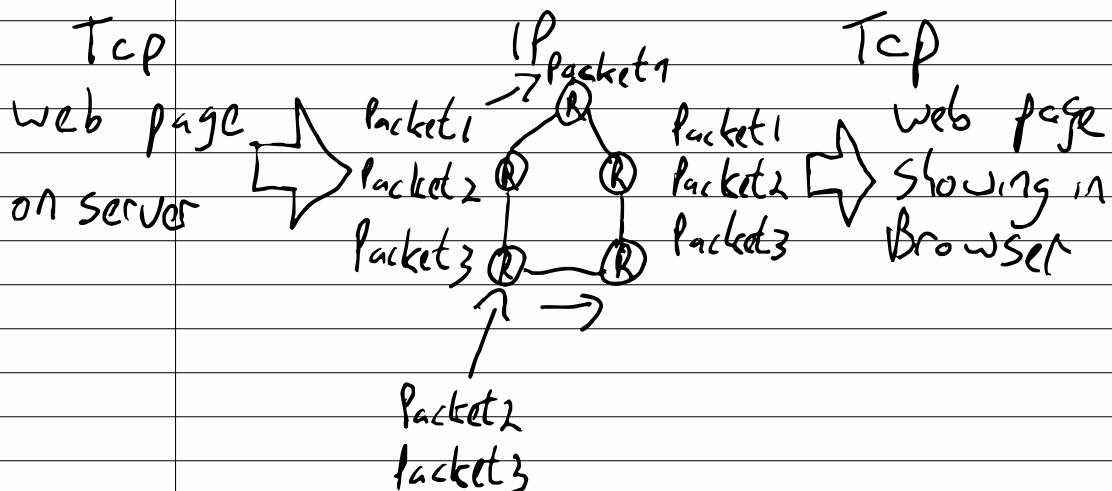

## Tcp Broadcasting

Transmission Control Protocol is a protocol that establishes and maintains a network conversation, where Client and Server can exchange data.

### Layers of Tcp

The Link layer is the physical network equipment used to interconnect nodes and servers  
The internet layer connects hosts to one another across networks  
The transport layer resolves all host-to-host communication  
The application layer is utilized to ensure communication between applications on a network

Tcp is reliable, it provides the recovery of segments that got lost, damaged, duplicate or received packets out of order. Tcp also requires that an acknowledgement message is received.

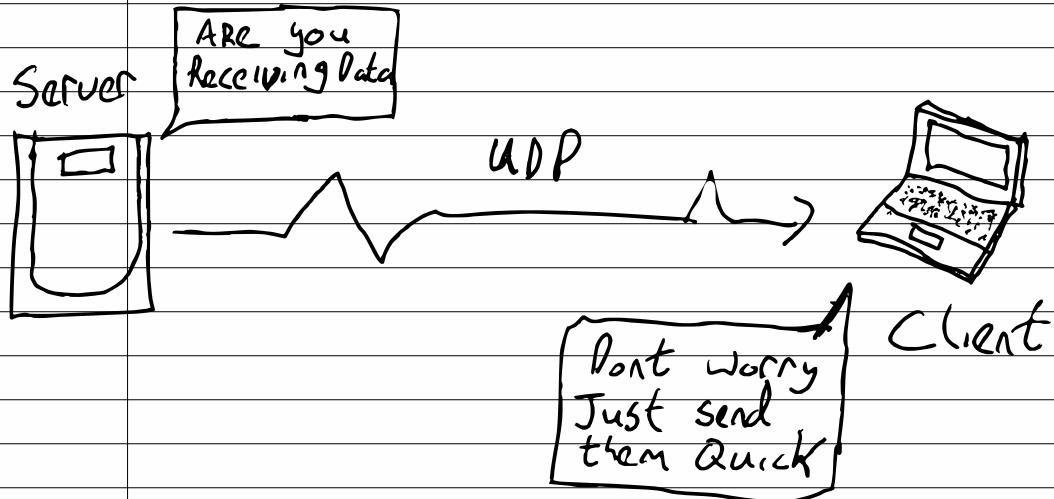

05/11/2019

## UDP Broadcasting

User Data Protocol works by encapsulating data in a UDP packet. The data consists of source and destination Ports to communicate on, the packet length and check-sum. When the packet is encapsulated they are sent to the client.

UDP is connectionless internet protocol. Sends out files doesn't check if they arrived.

Error recovery is not attempted  
UDP header size is 8 bytes

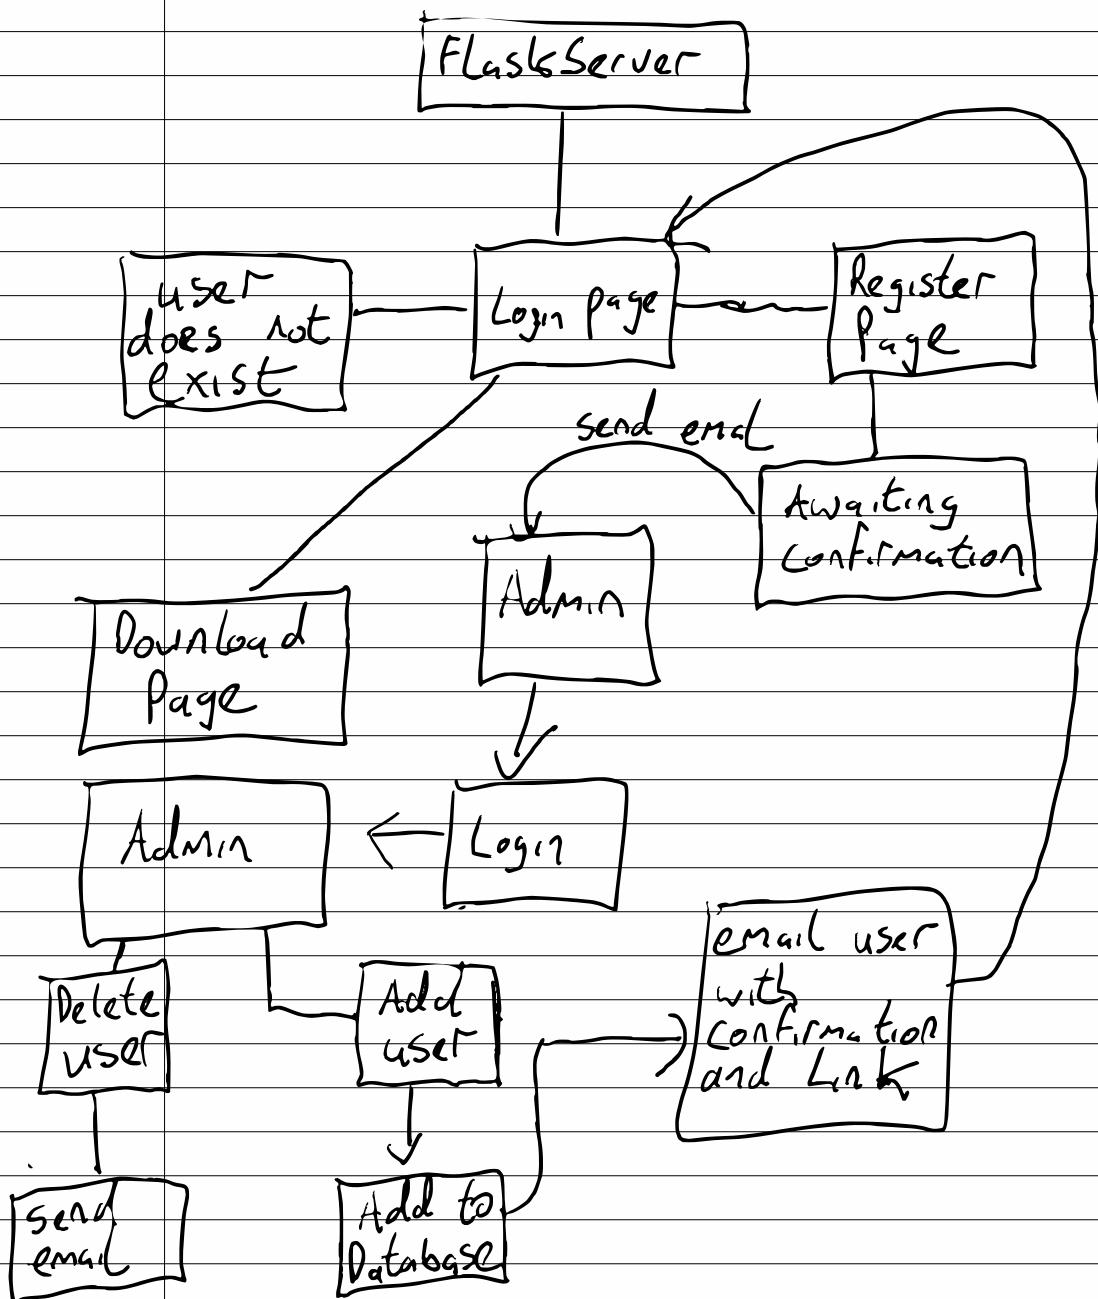

OS/11/2019

Transmission Control Protocol	User Datagram Protocol
Tcp is connection-oriented	UDP is the datagram-oriented
Tcp is reliable it guarantees delivery of data to destination	UDP delivery of data to the destination can not be guaranteed
Tcp provides extensive error checking, it provides flow control and acknowledgement of data.	UDP only has basic error checking - checksum
Sequencing of data is a feature of tcp (packets arrive in order)	Data is not sequenced this has to be done from Application layer
Tcp is comparatively slower than UDP	UDP is faster, simpler and more efficient than tcp
Tcp is heavy weight	UDP is light weight
Tcp doesn't support broadcasting	UDP supports broadcasting
Retransmission of lost packets is possible in tcp	There is no retransmission of lost packets

I am going to use TCP for streaming the video and audio from my raspberry pi Server, it may be slower than UDP but reliability is what I am looking for

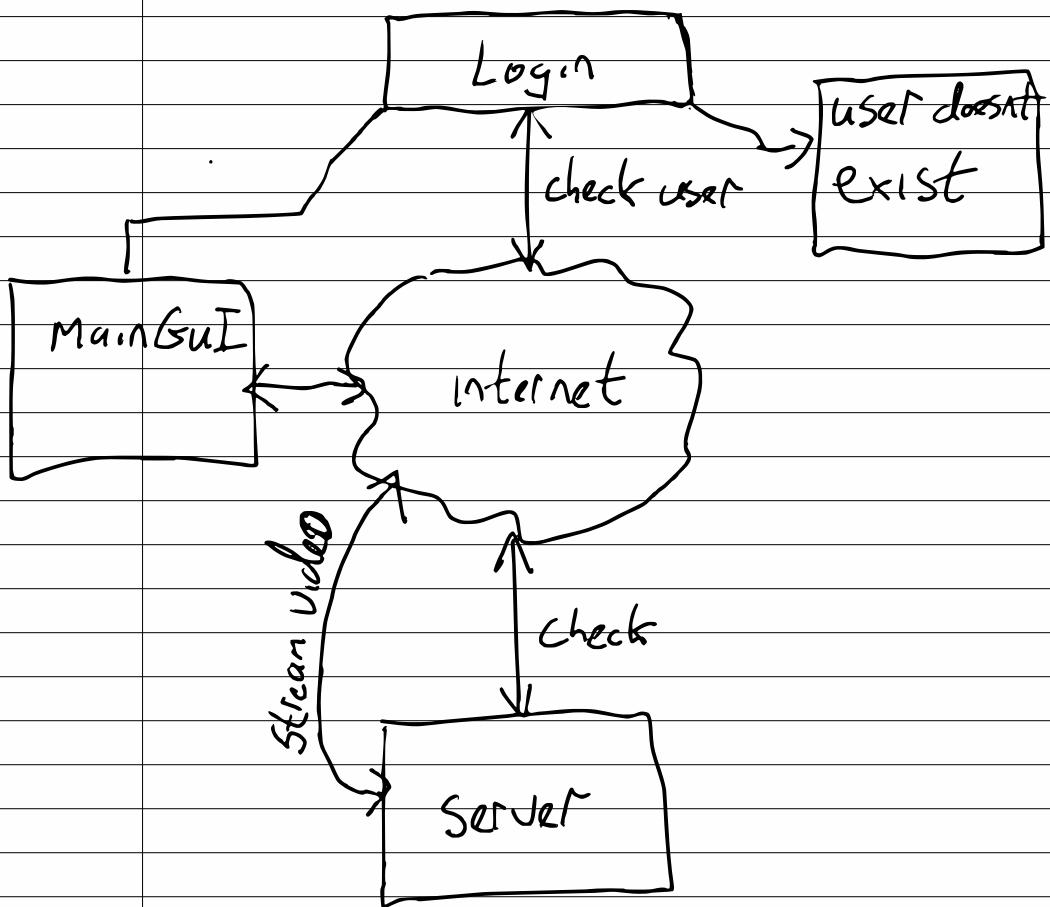

12/11/2019

# Registration Server

12/11/2019

# JAVA Stream Server and JAVA GUI Client

12/11/2019

## Base64 Encoding

Base64 encoding is the process of converting binary into limited character set of 64 characters. The characters are [A-Z], [a-z], [0-9], [+] and [/]. They all make up 64 characters.

The base64 encoded data ends up being longer than the original data, because for every 3 bytes of binary data, there are at least 4 bytes of Base64 encoded data. This is due to squeezing the data into smaller sets of characters.

### Base64 Steps

- The text is converted into its respective decimal value (ASCII value).
- The decimal values are then converted into their binary equivalents.
- The binary values are concatenated into one.
- The binary concatenation is divided into sections with each section containing only 6 bits.
- The equal sets of 6 bits are converted into their decimal equivalents.
- Finally, the decimal values are converted into their base64 values.
